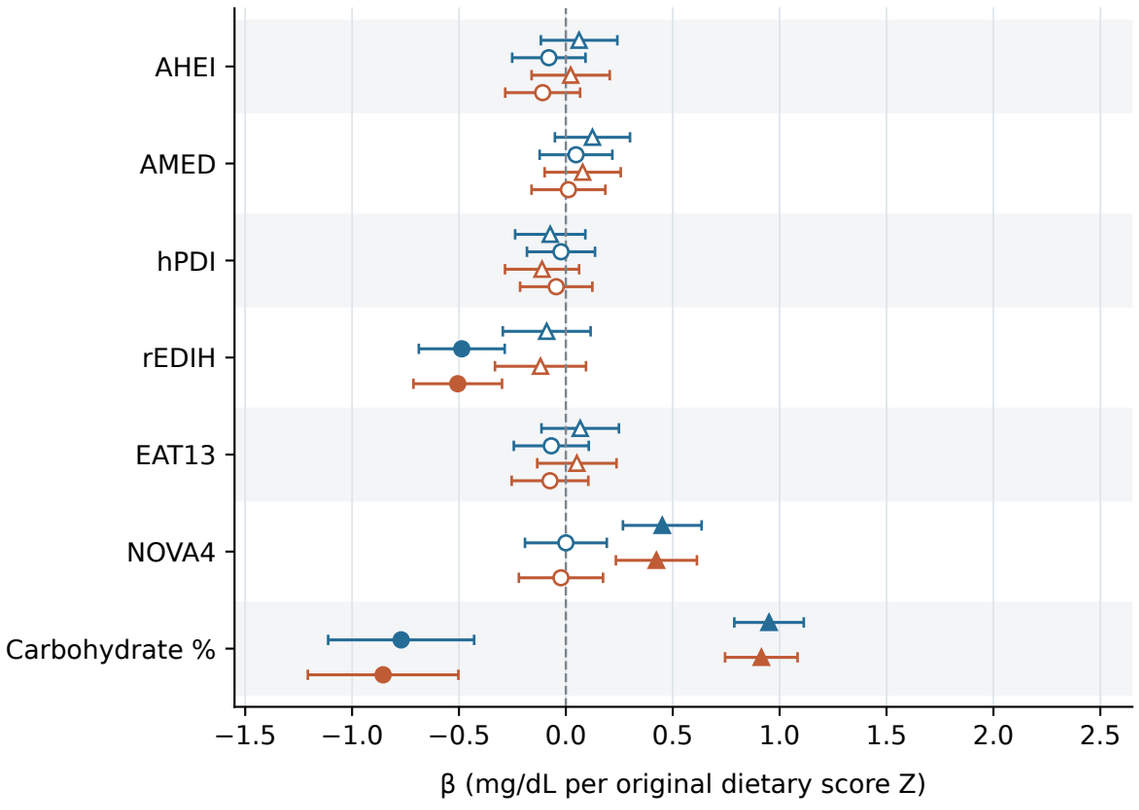
Dietary scores relate to distinct aspects of meal responses

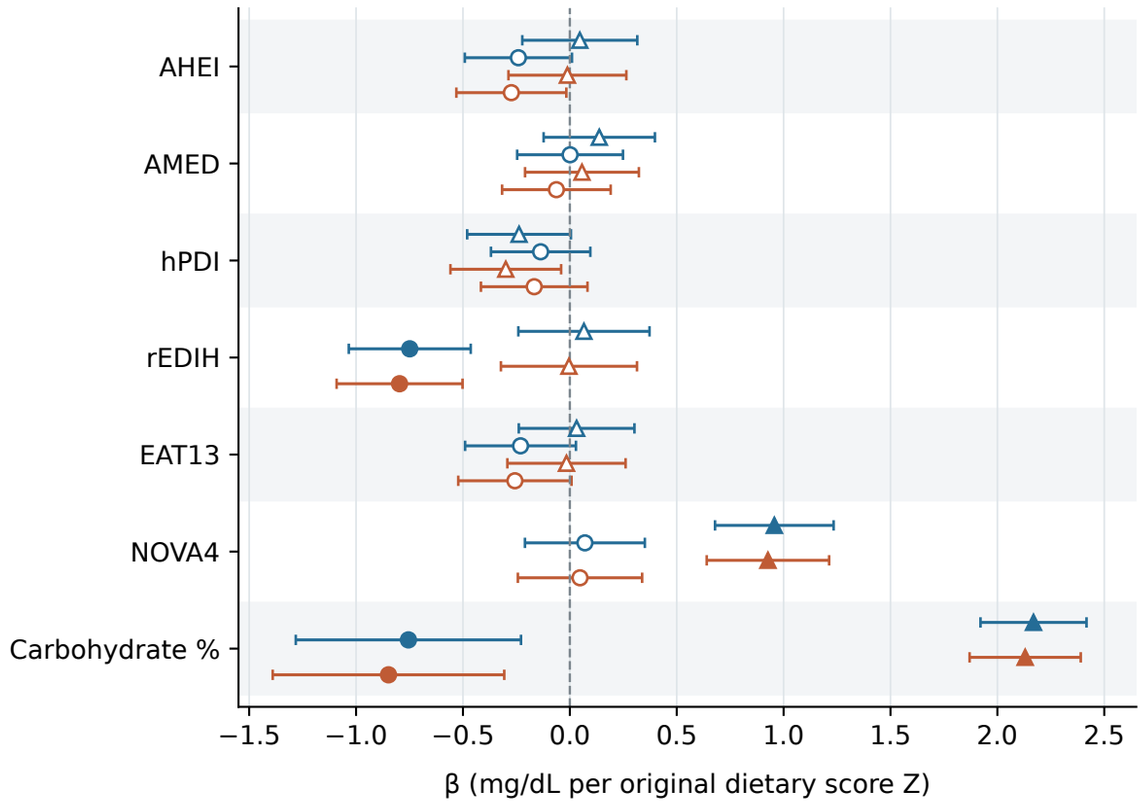
All seven scores retained • Original and joint samples overlap • Pointwise 95% confidence intervals

Original · Joint · Background (A–B) · Full adjustment (A–B) · Contrast D (C–D)

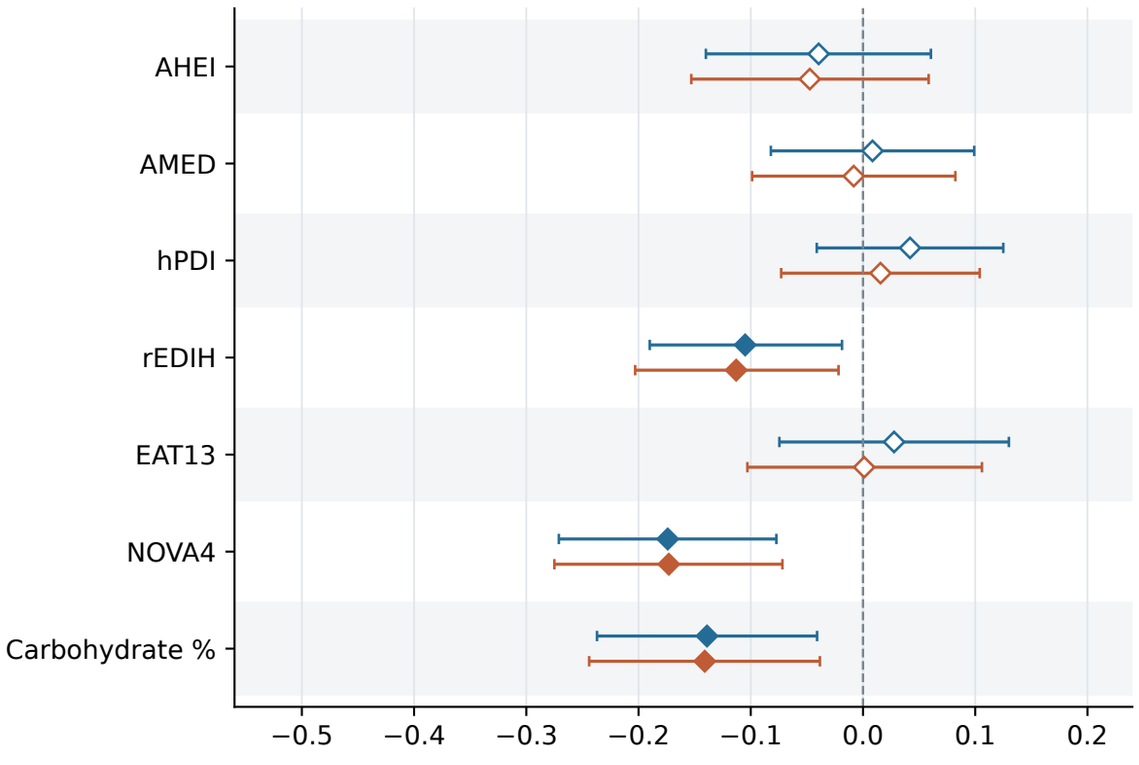
A Net increment: between-person association



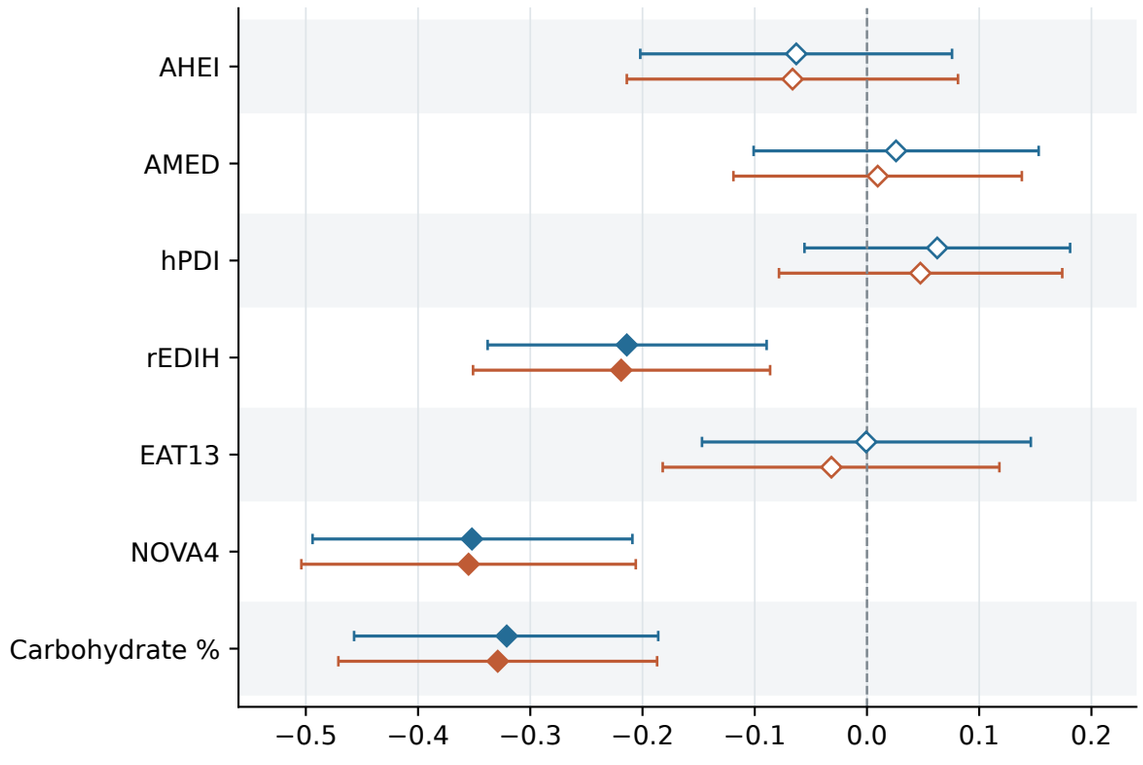
B Peak rise: between-person association



C Net increment: carbohydrate interaction



D Peak rise: carbohydrate interaction



Filled: q < 0.05; open: q ≥ 0.05. A–B: original 70-test family per sample. C–D: original 14-test families.

D compares carbohydrate-associated changes at score Q75 versus Q25; carbohydrate anchors vary by score and sample.

D is neither an absolute between-group glucose difference nor the total carbohydrate slope. Do not rank scores by D.
